TECHNOLOGY FEATURE

CHROMOSOMAL DNA COMES INTO FOCUS

Imaging techniques to probe the shape of chromatin are revealing the dynamism of the DNA–protein complex.

This multicoloured image of chromatin was created using multiplexed fluorescence *in situ* hybridization and super-resolution microscopy.

BY JEFFREY M. PERKEL

Molecular models suggest that chromosomes assemble in an ordered, hierarchical way: DNA wraps around proteins called histones to form nucleosomes, which fold into 30-nanometre fibres, then 120-nanometre ‘chromonema’, and further into larger chromatin structures until they reach their most tightly coiled form — the characteristic X-shaped bodies.

Under the high-resolution microscopes of biophysicist Xiaowei Zhuang, these chromosomes resemble something from the mind of surrealist painter Salvador Dalí. Zhuang, who is at Harvard University in Cambridge, Massachusetts, is one of a growing number of researchers charting the topology of the genome to decode the relationship between chromatin structure and function. Using a highly multiplexed form of fluorescence *in situ* hybridization (FISH) in combination

with super-resolution microscopy, Zhuang’s team mapped several million bases of human chromosome 21 at 30 kilobase resolution, tracing their shape like a dot-to-dot puzzle¹. The resulting multicoloured image resembles one of the melting clocks in Dalí’s 1931 *The Persistence of Memory*.

But that was in just one cell. In each cell that Zhuang’s team looked at, the chromosome assumed a different shape — each one a different solution to some ineffable cellular calculation. “There is very strong cell-to-cell heterogeneity,” Zhuang says.

Ting Wu, a geneticist at Harvard Medical School in Boston, Massachusetts, who combined a similar super-resolution FISH approach with sequencing analysis to map a chunk of human chromosome 19 to 10 kilobase resolution in late 2018, observed similar heterogeneity². The chromosomes in that study look more like space-filling protein models, and when the team overlaid

markers of inactive and active chromatin, they observed distinct patterns. “We have never seen a structure of that 8.6-megabase region twice,” says Wu. “The variability, which people had thought was there, and there are hints of, is truly astounding.” Brian Beliveau, a genomic scientist at the University of Washington, Seattle, and a co-author of the paper, says bluntly: “Chromosomes are almost certainly like snowflakes.”

A DEEPER LOOK

In biology, function derives from form. It is shape, as a result of amino-acid sequence, that determines whether a given protein acts as a structural scaffold, signalling molecule or enzyme. The same is probably true of the genome. But until recently, there was no easy way for researchers to determine that structure.

Using a sequencing-based method called Hi-C, which calculates the frequencies at which different chromosomal segments ►

A “hit-and-stick” model for gene activation

What next?

Can we see the path of chromatin @10Kb resolution? images + Hi-C + modeling

Is genome structure more conserved than sequence?

The End!

Genome 3D structure is more conserved than 1D in primates

Unpublished

François Serra
Yasmina Cuartero
with Marquès Lab (UPF, Barcelona)

- Proteome is 10sM AAs in 10,000s of proteins
- 20 AA in average ~500 AA length
- ~150 structural AA for ~5 AA for function
- MM+QM
- No confinement
- Dynamics

- Genome is 1,000sM NTs in 10s of chroms
- 4 NT in average ~100M NTs length
- ~??? structural NTs for ~??? NTs for function
- Packing + Phase Separation + Modelers
- Confinement
- ++++Dynamics

Hi-C matrices from lymphoblasts in seven primates

Human

Chimpanzee

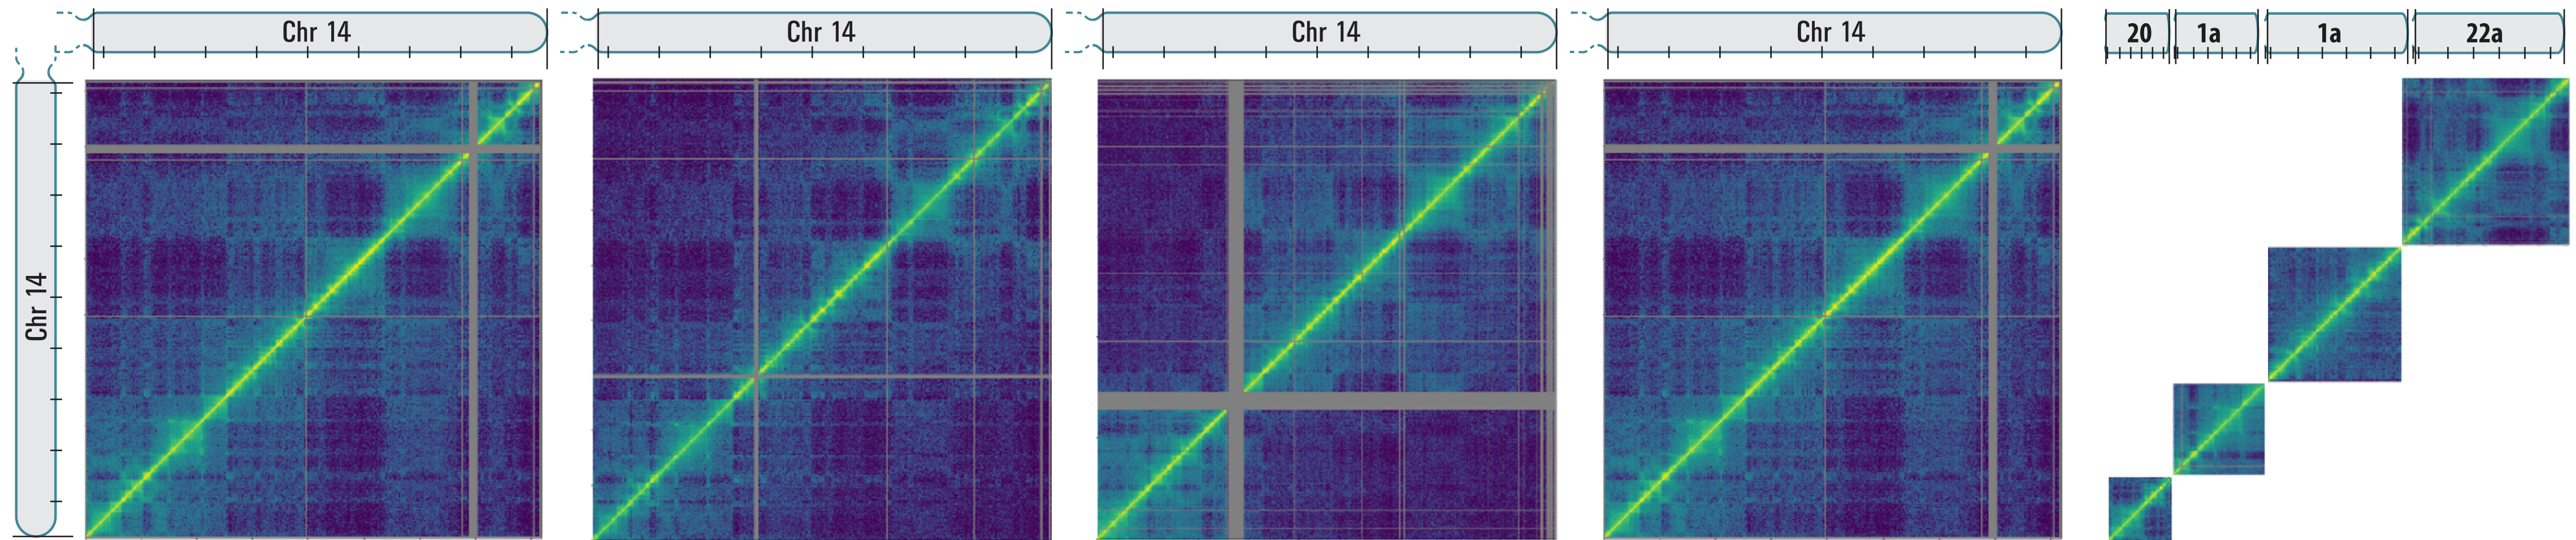

Gorilla

Orangutan

Gibbon

Macaque

Marmoset

Mouse

Synteny breakpoints in 3D

Two regions of at least 100 kb separated by more than 750 kb (including trans chromosomal)
Common detections from Ruiz-Herrera's Lab (@300Kb res) and our lab (ENSEMBLE @1Kb res)

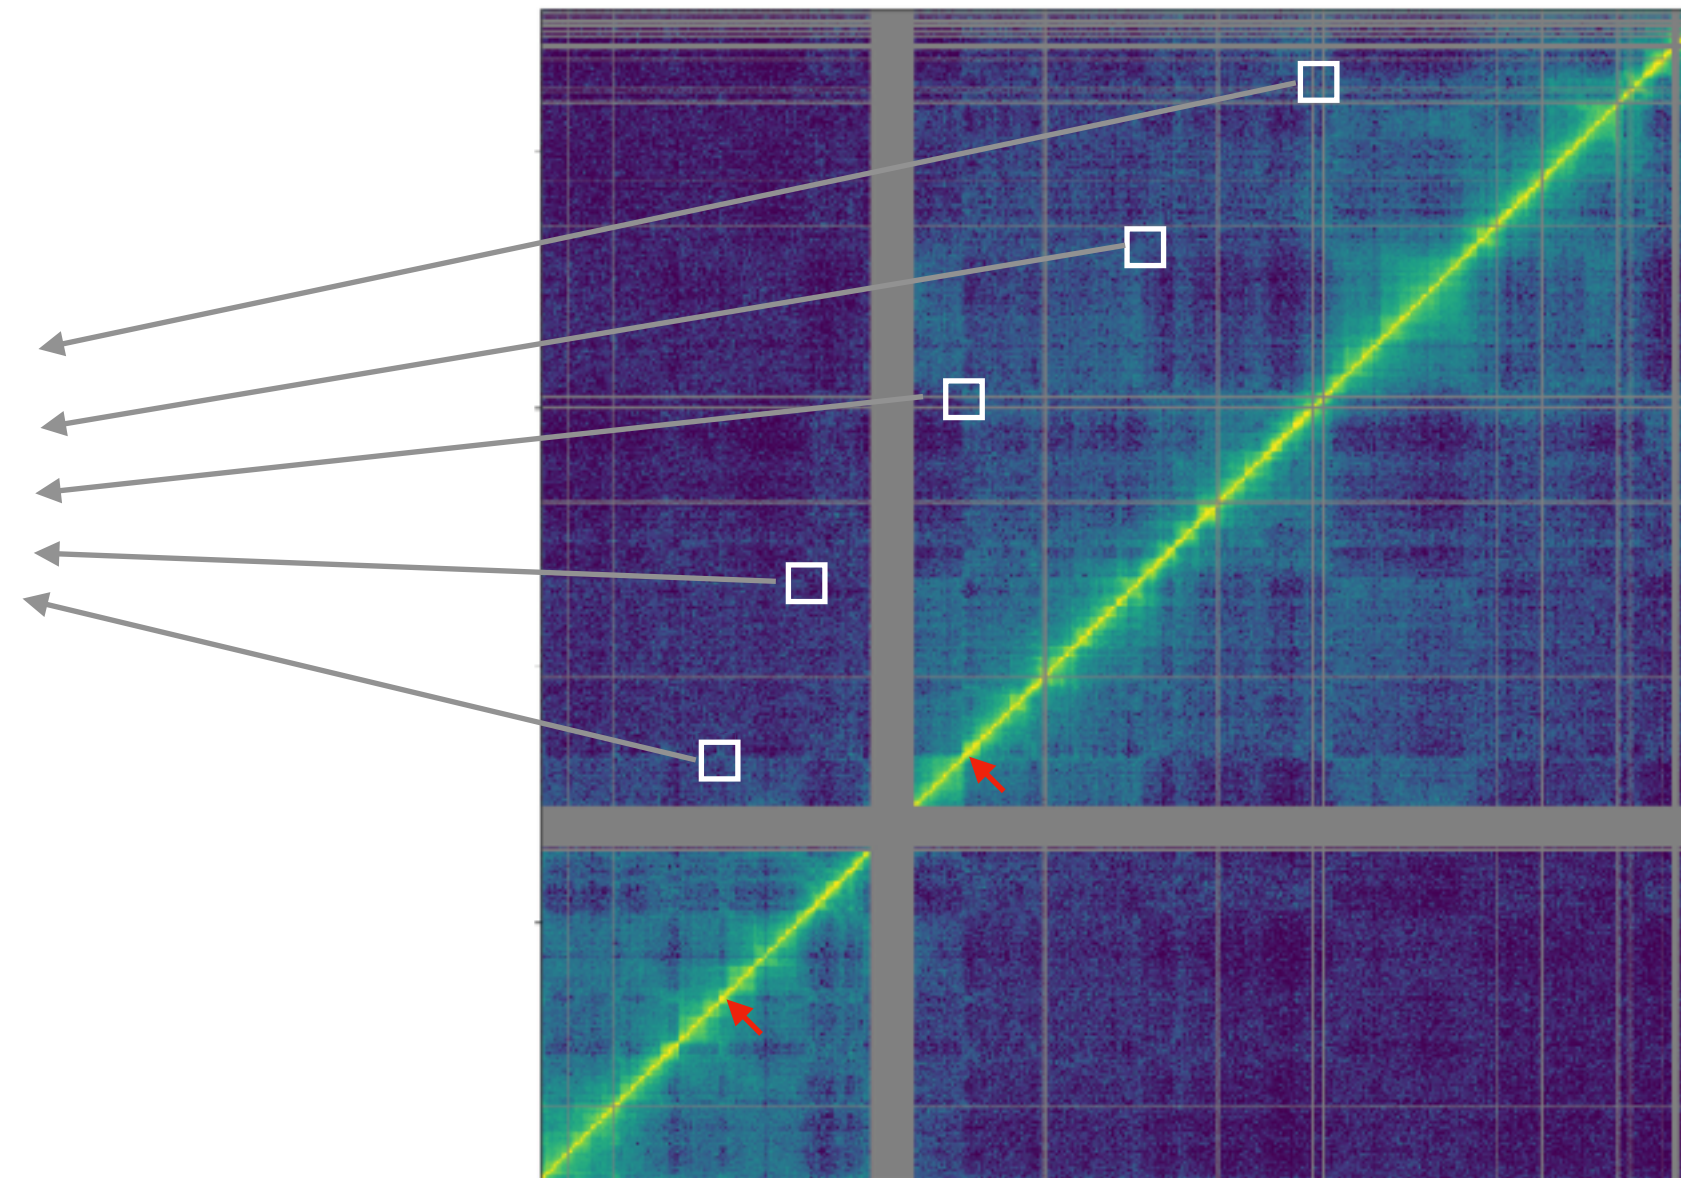

Syntenic breakpoints in 3D

Two regions of at least 100 kb separated by more than 750 kb (including trans chromosomal)
Common detections from Ruiz-Herrera's Lab (@300Kb res) and our lab (ENSEMBLE @1Kb res)

Chimp chr14

Synteny breakpoints in 3D

Two regions of at least 100 kb separated by more than 750 kb (including trans chromosomal)

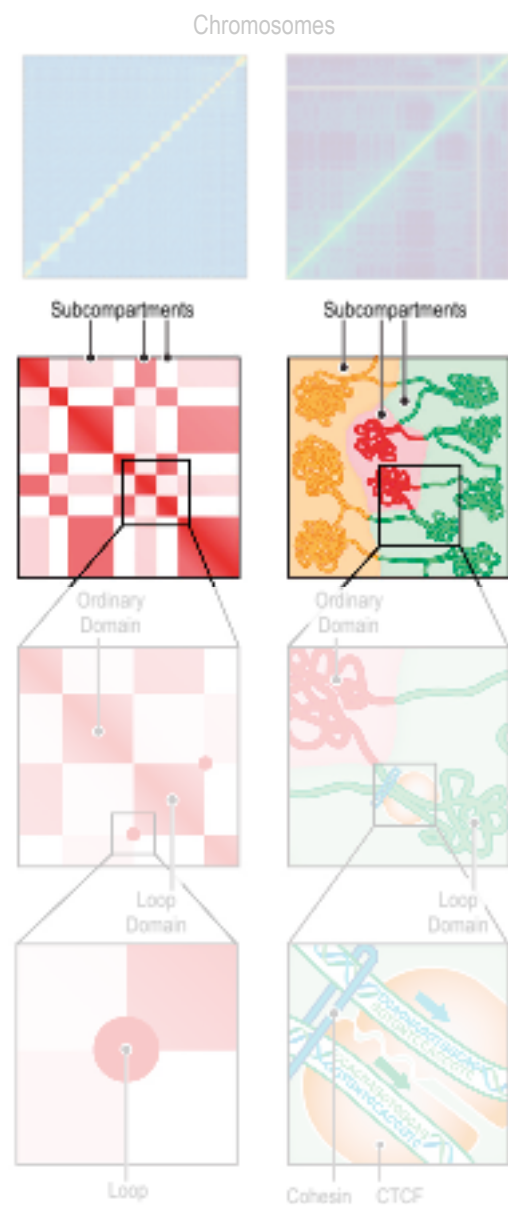

Duplications

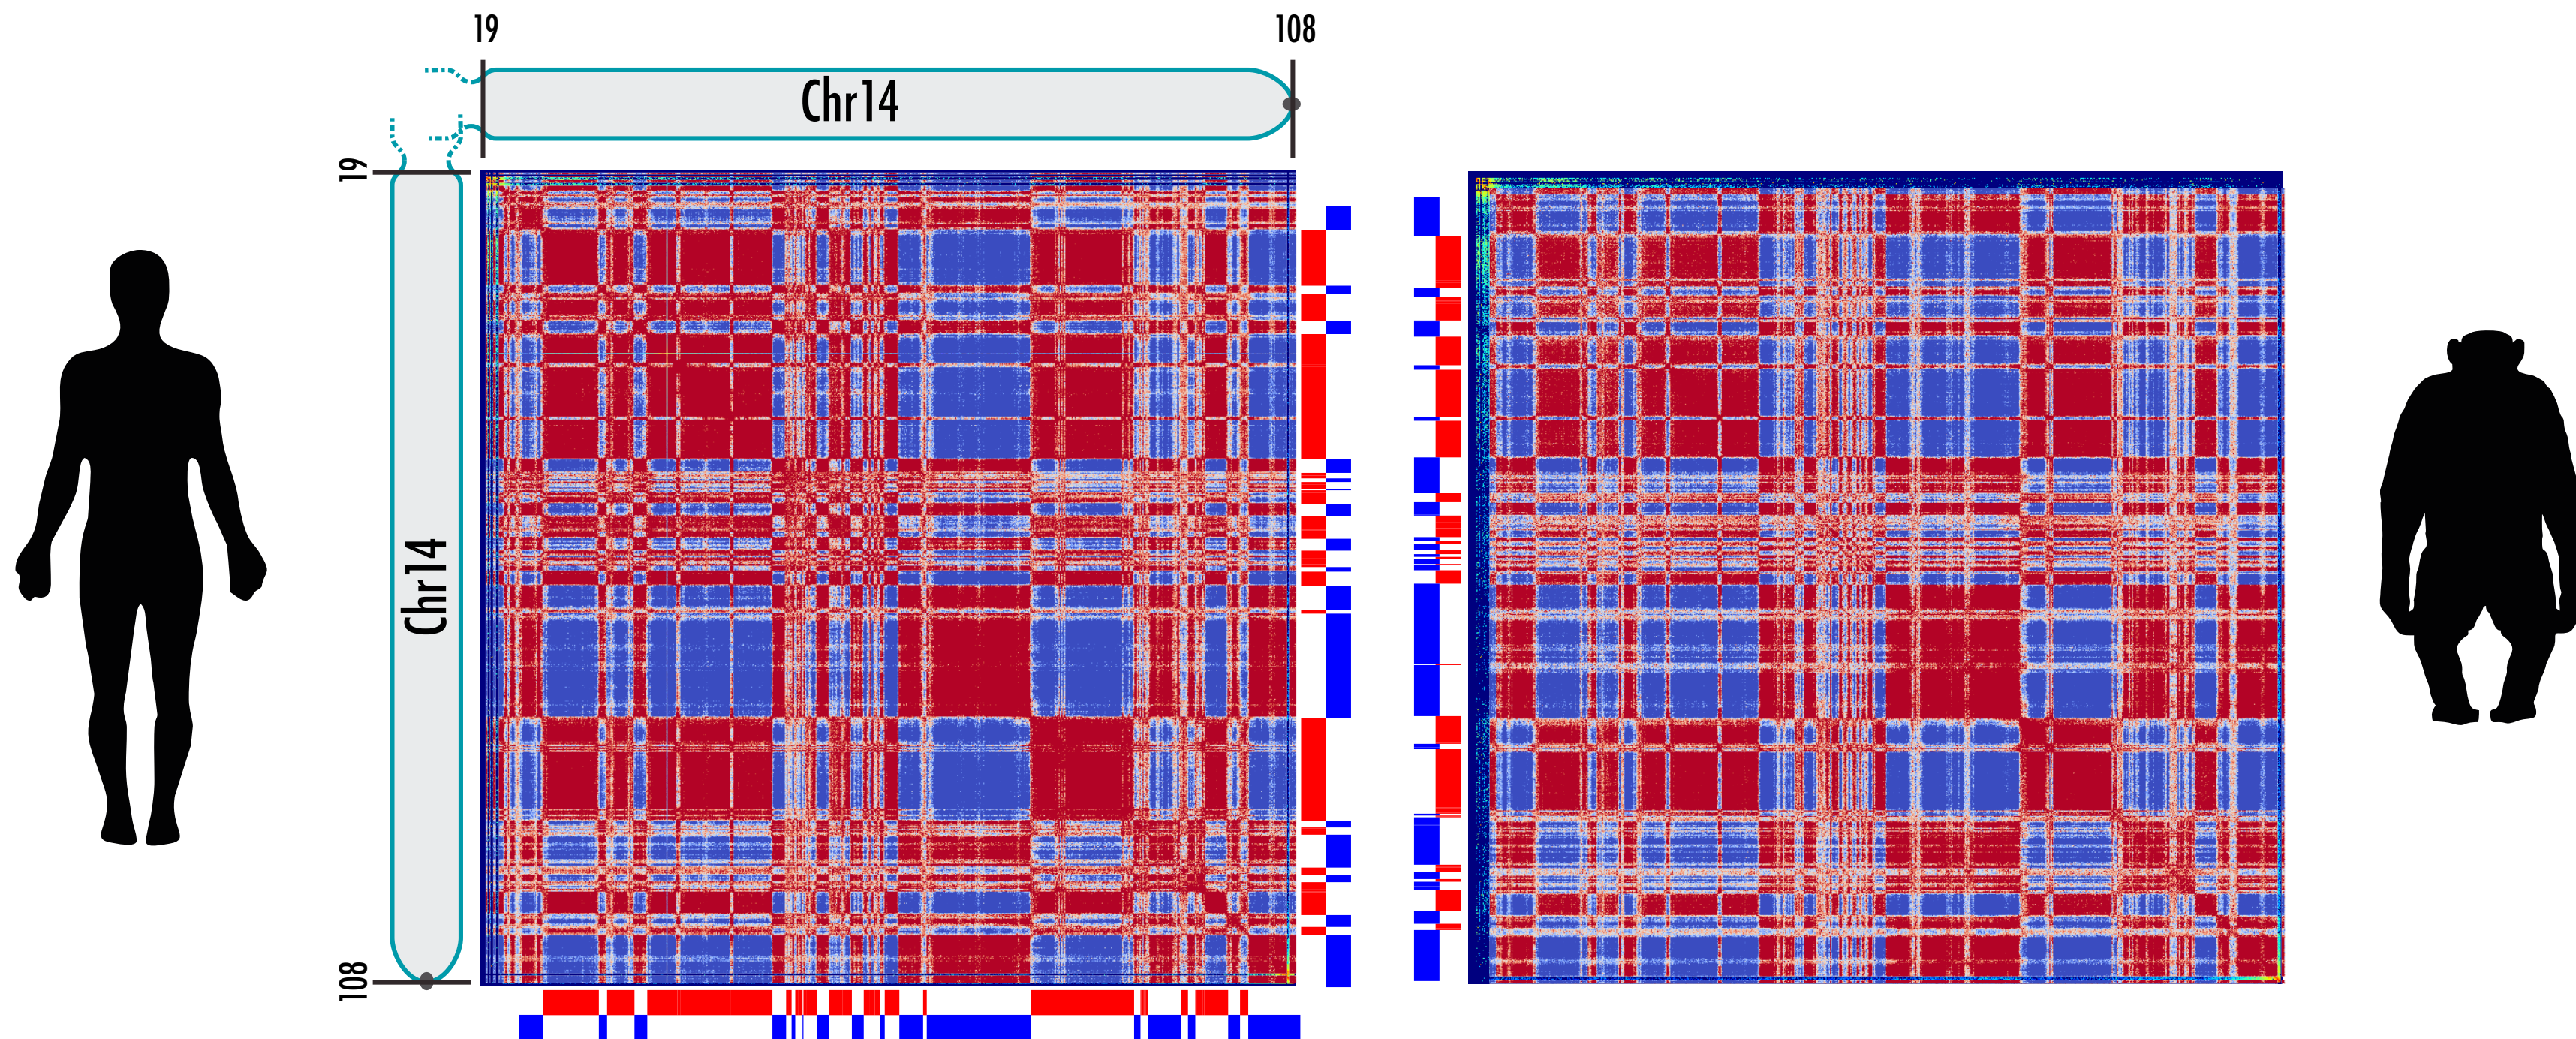

Duplicated METTL2 locus in human with respect to primates

Genome compartments

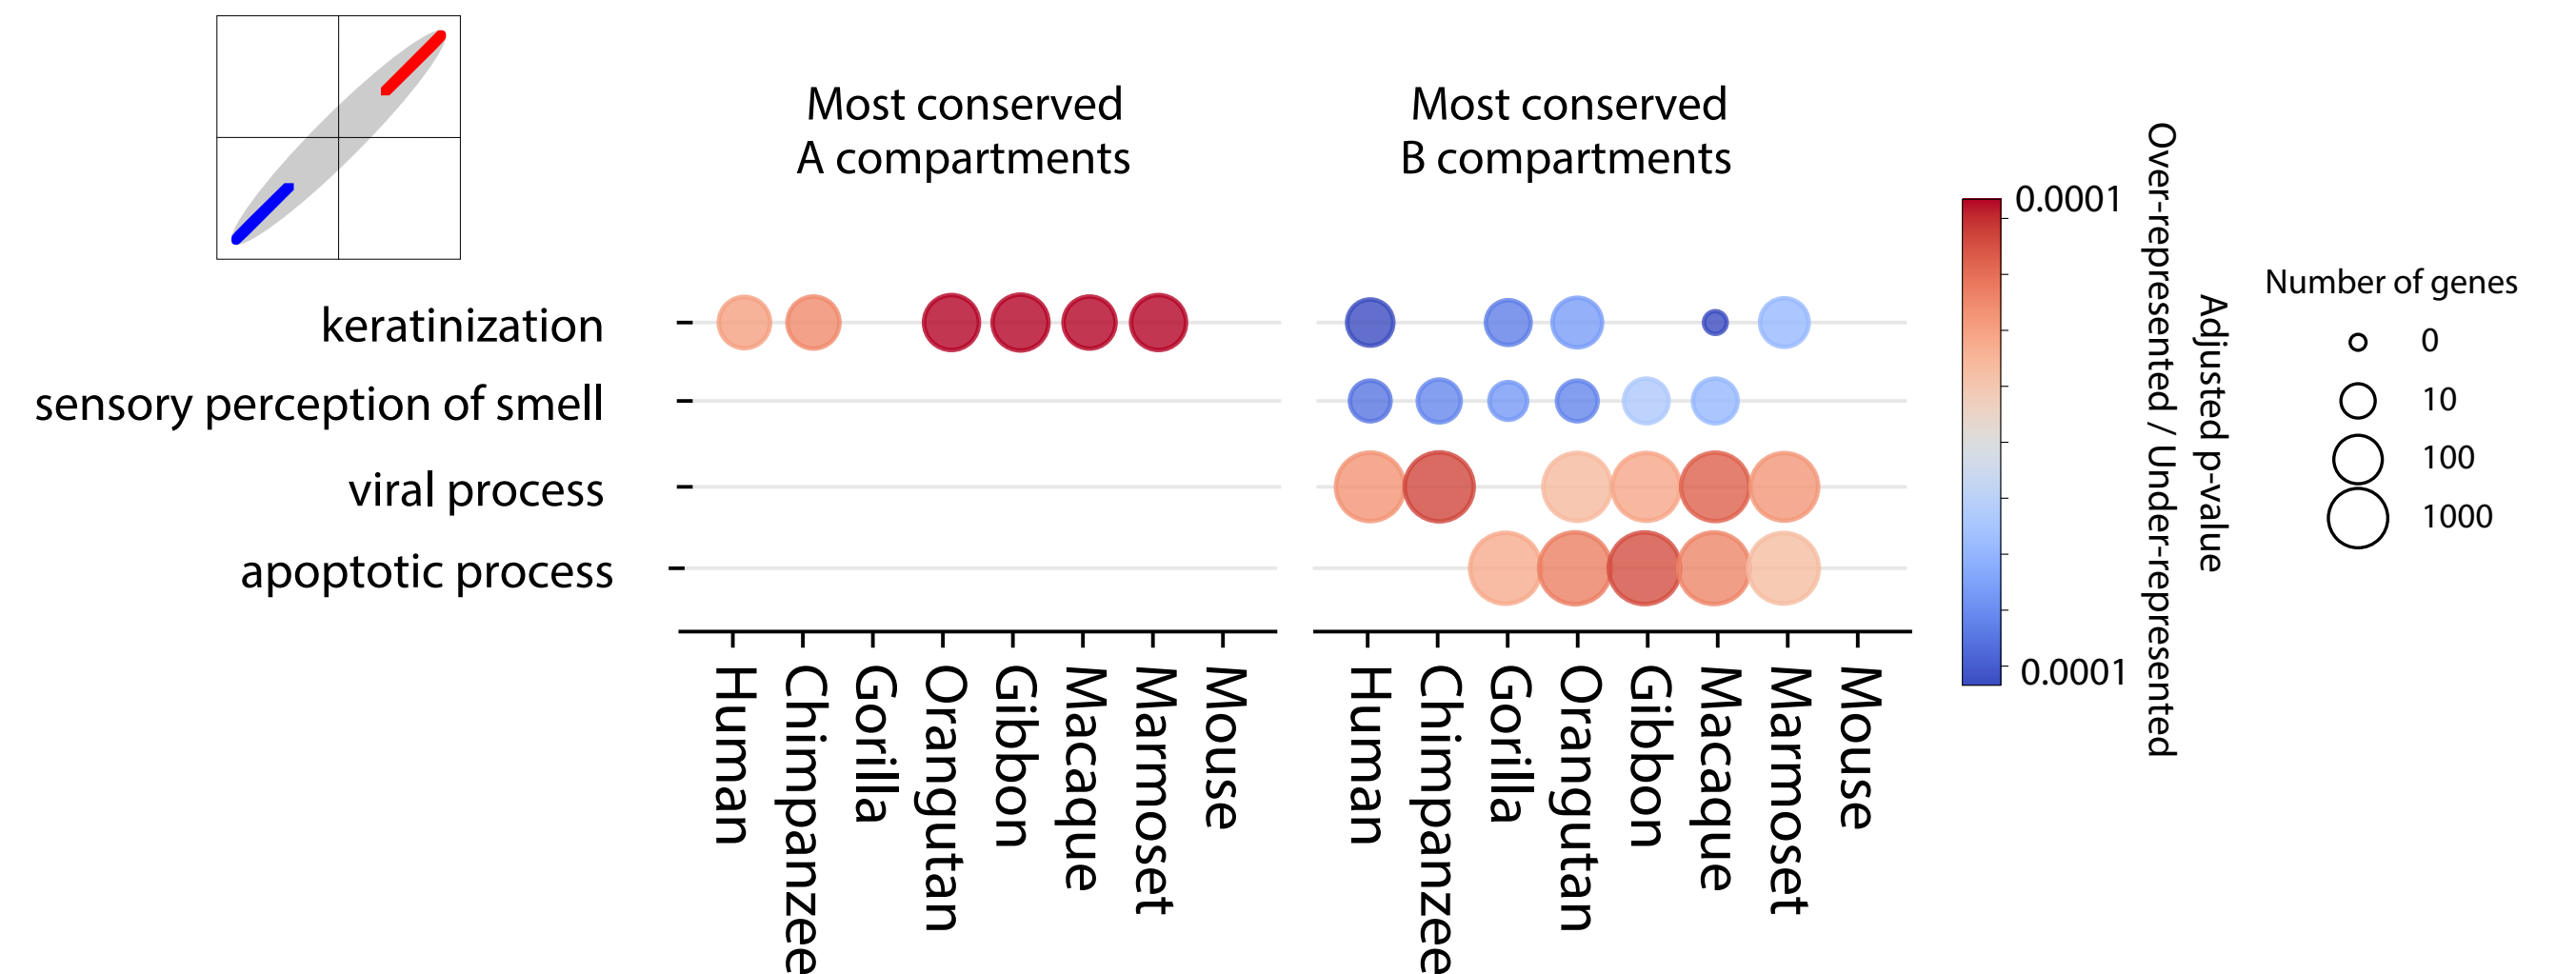

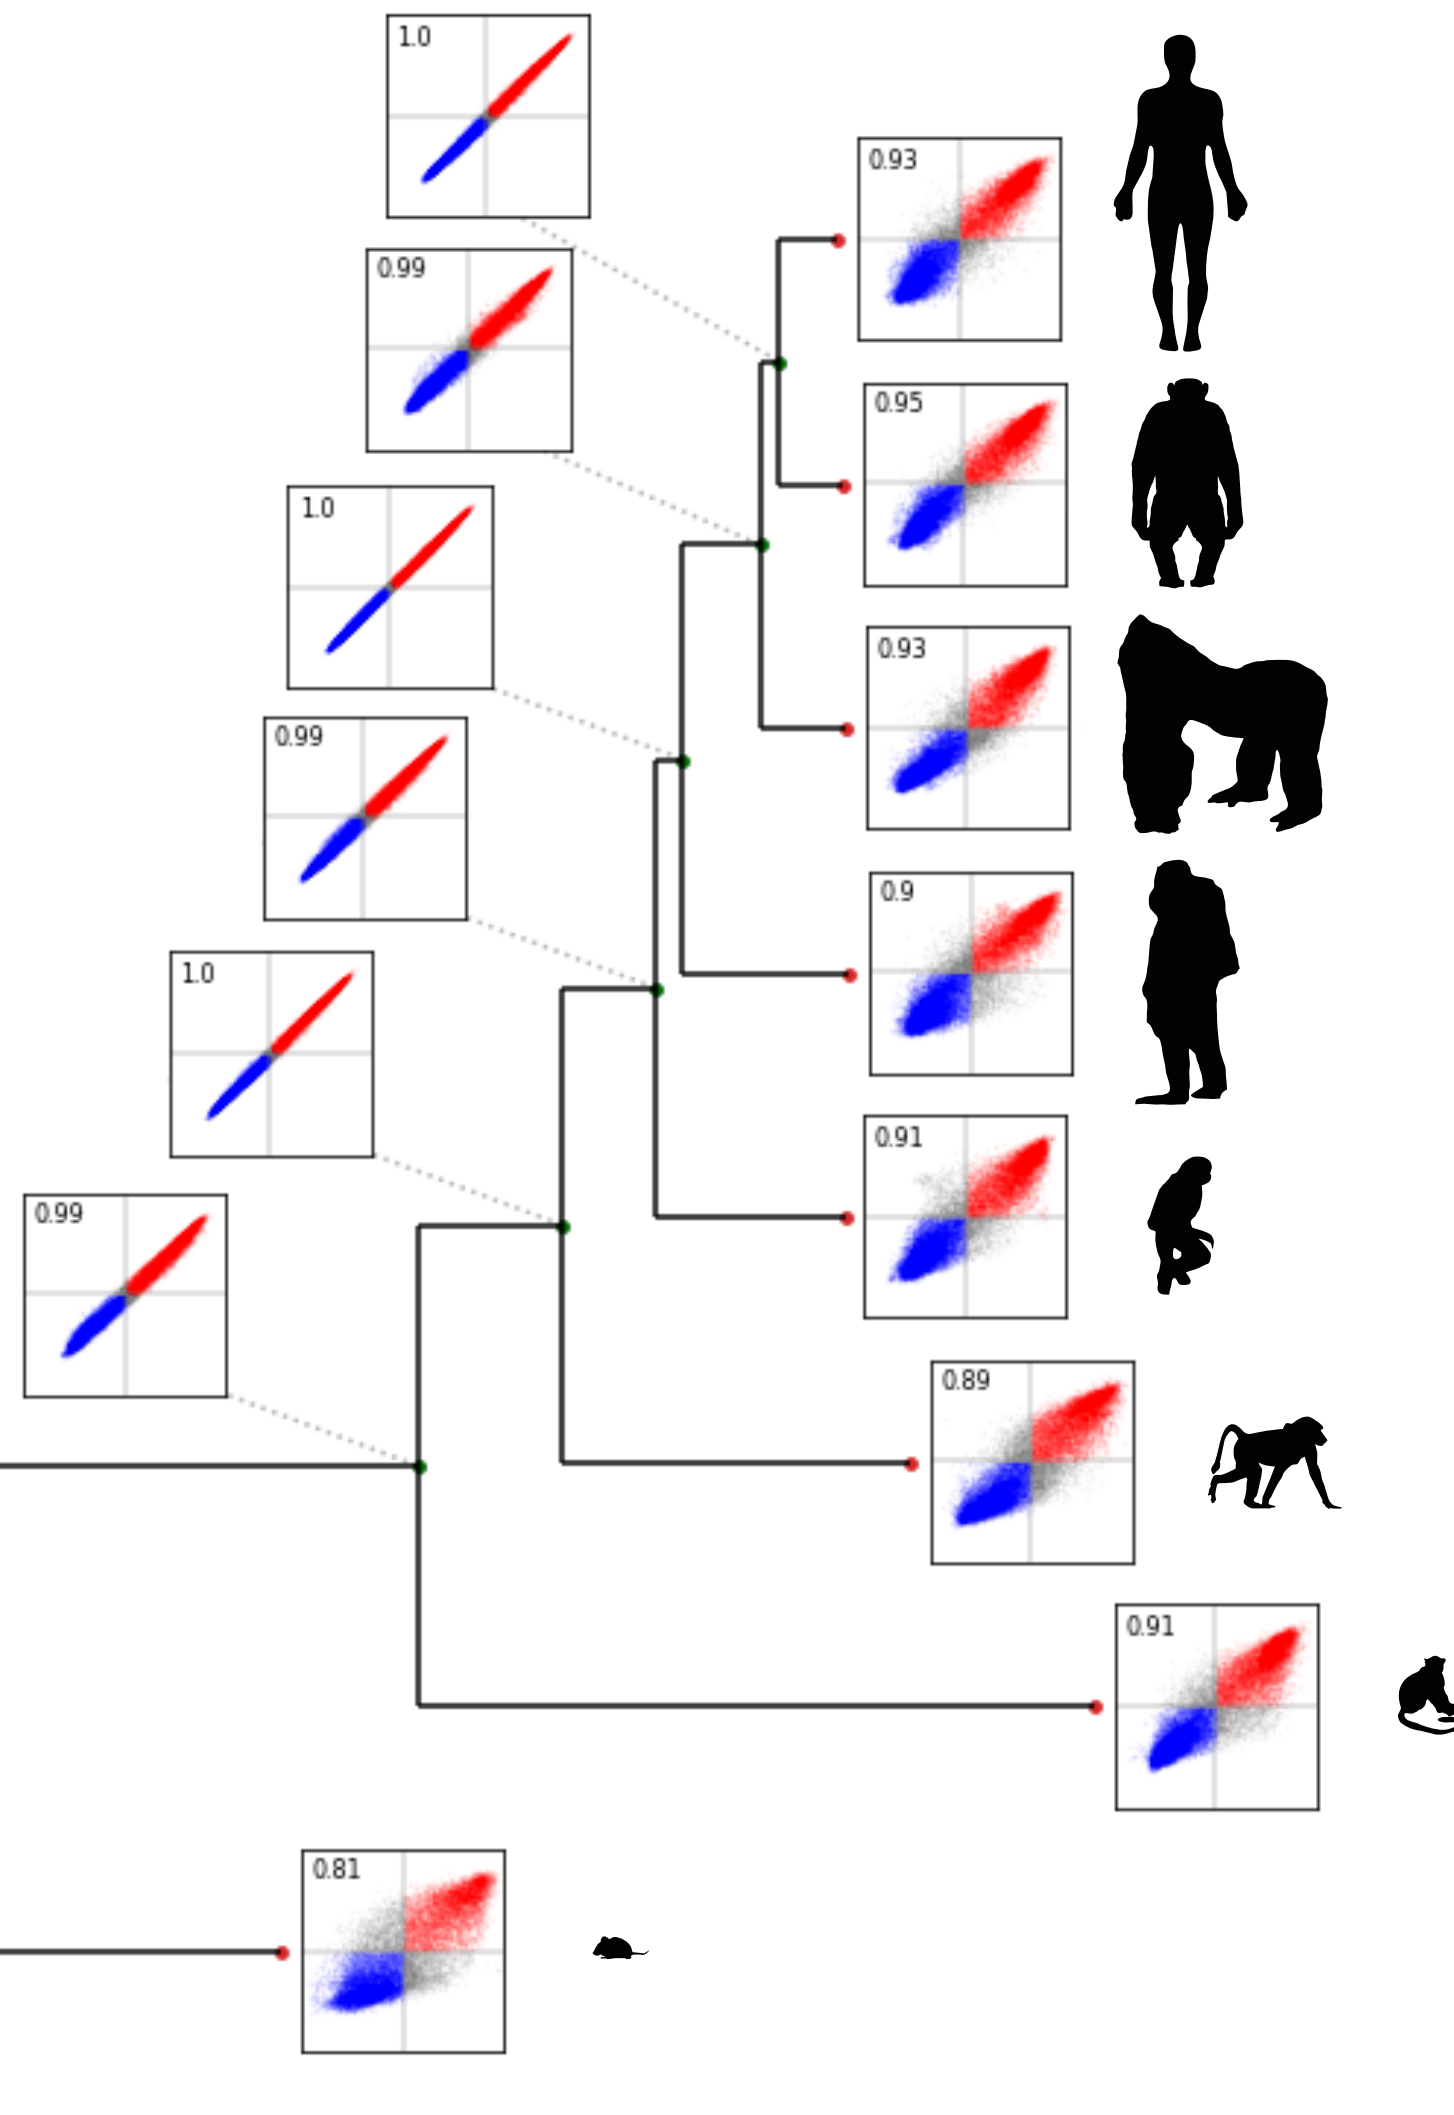

Conservation of the A/B compartments

Genome compartments

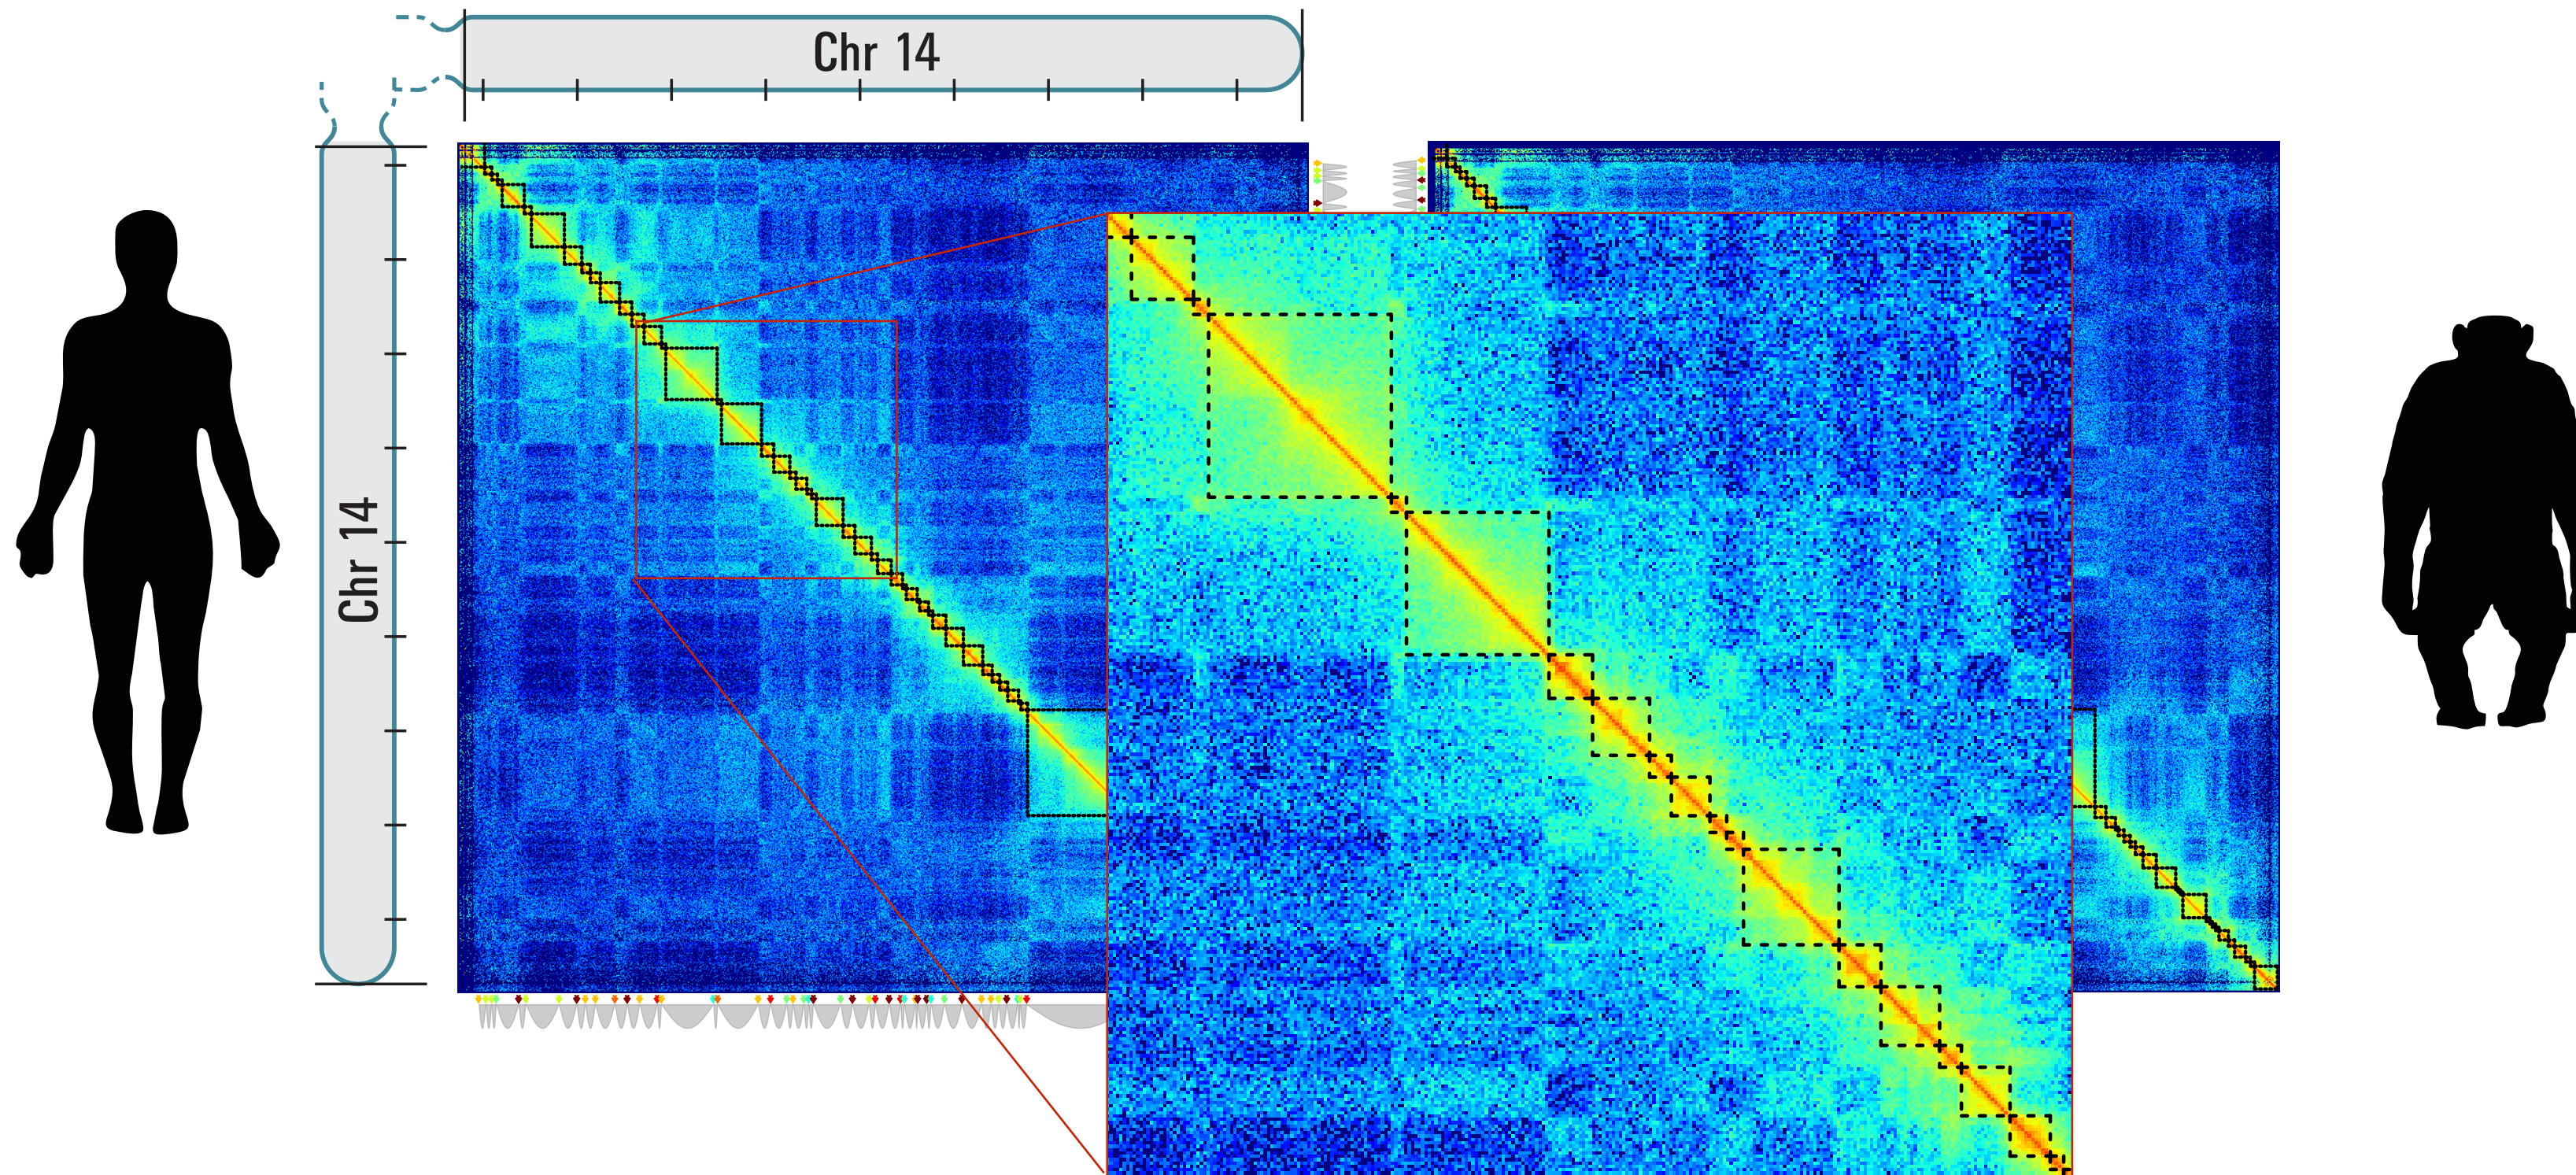

Conservation of the A/B compartments

Loops

Conservation of CTCF sites

Vietri Rudan, et al. Cell Rep. 2015 Mar 03; 10(8) 1297-1309
 Nakahashi et al. Cell Rep. 2013 May 30; 3(5) 1678-1689

Loops

Conservation of CTCF sites

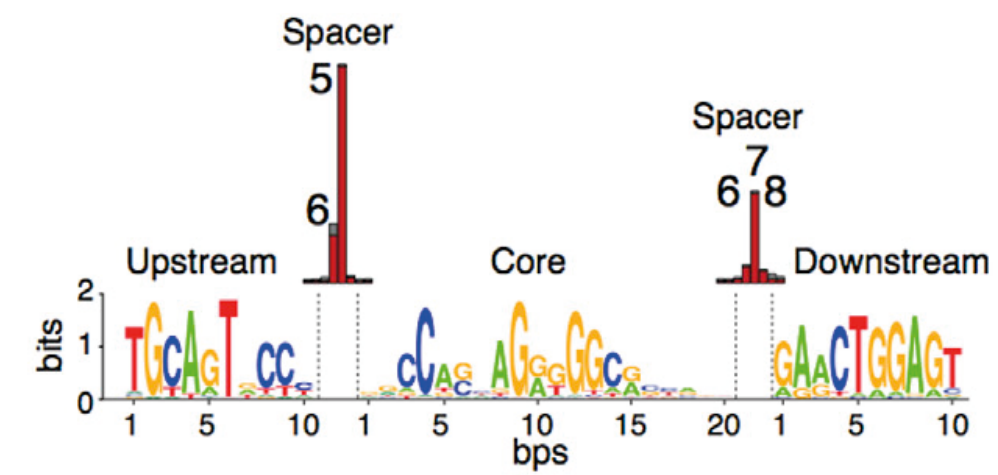

Human

Gibbon

Mouse

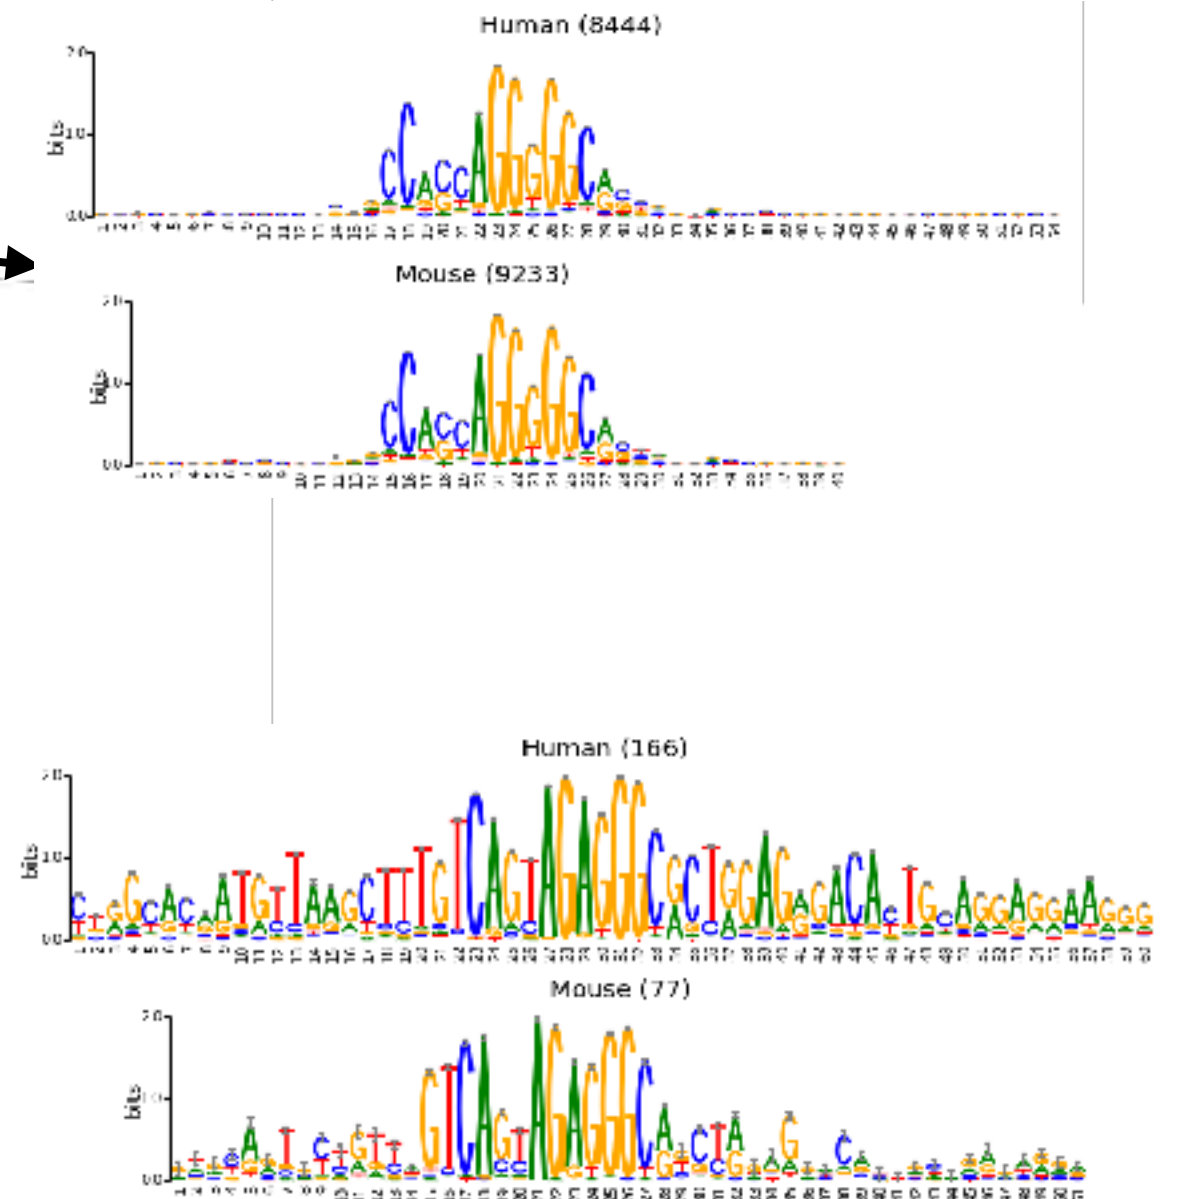

Loops

Conservation of CTCF sites

- >150 K sequences to align (all species together)
- Tree reconstruction using FastTree2
- Reduce the complexity filtering by node support
- Selection of 173 nodes with 0.9 bootstrap
- At least 100 CTCF sites (and at least 50 from single species)

Loops

Conservation of CTCF sites

- Motif (nucleotide content)

- Insulation/looping (interaction directionality)

- Enrichment in repetitive elements

Loops

Conservation of CTCF sites

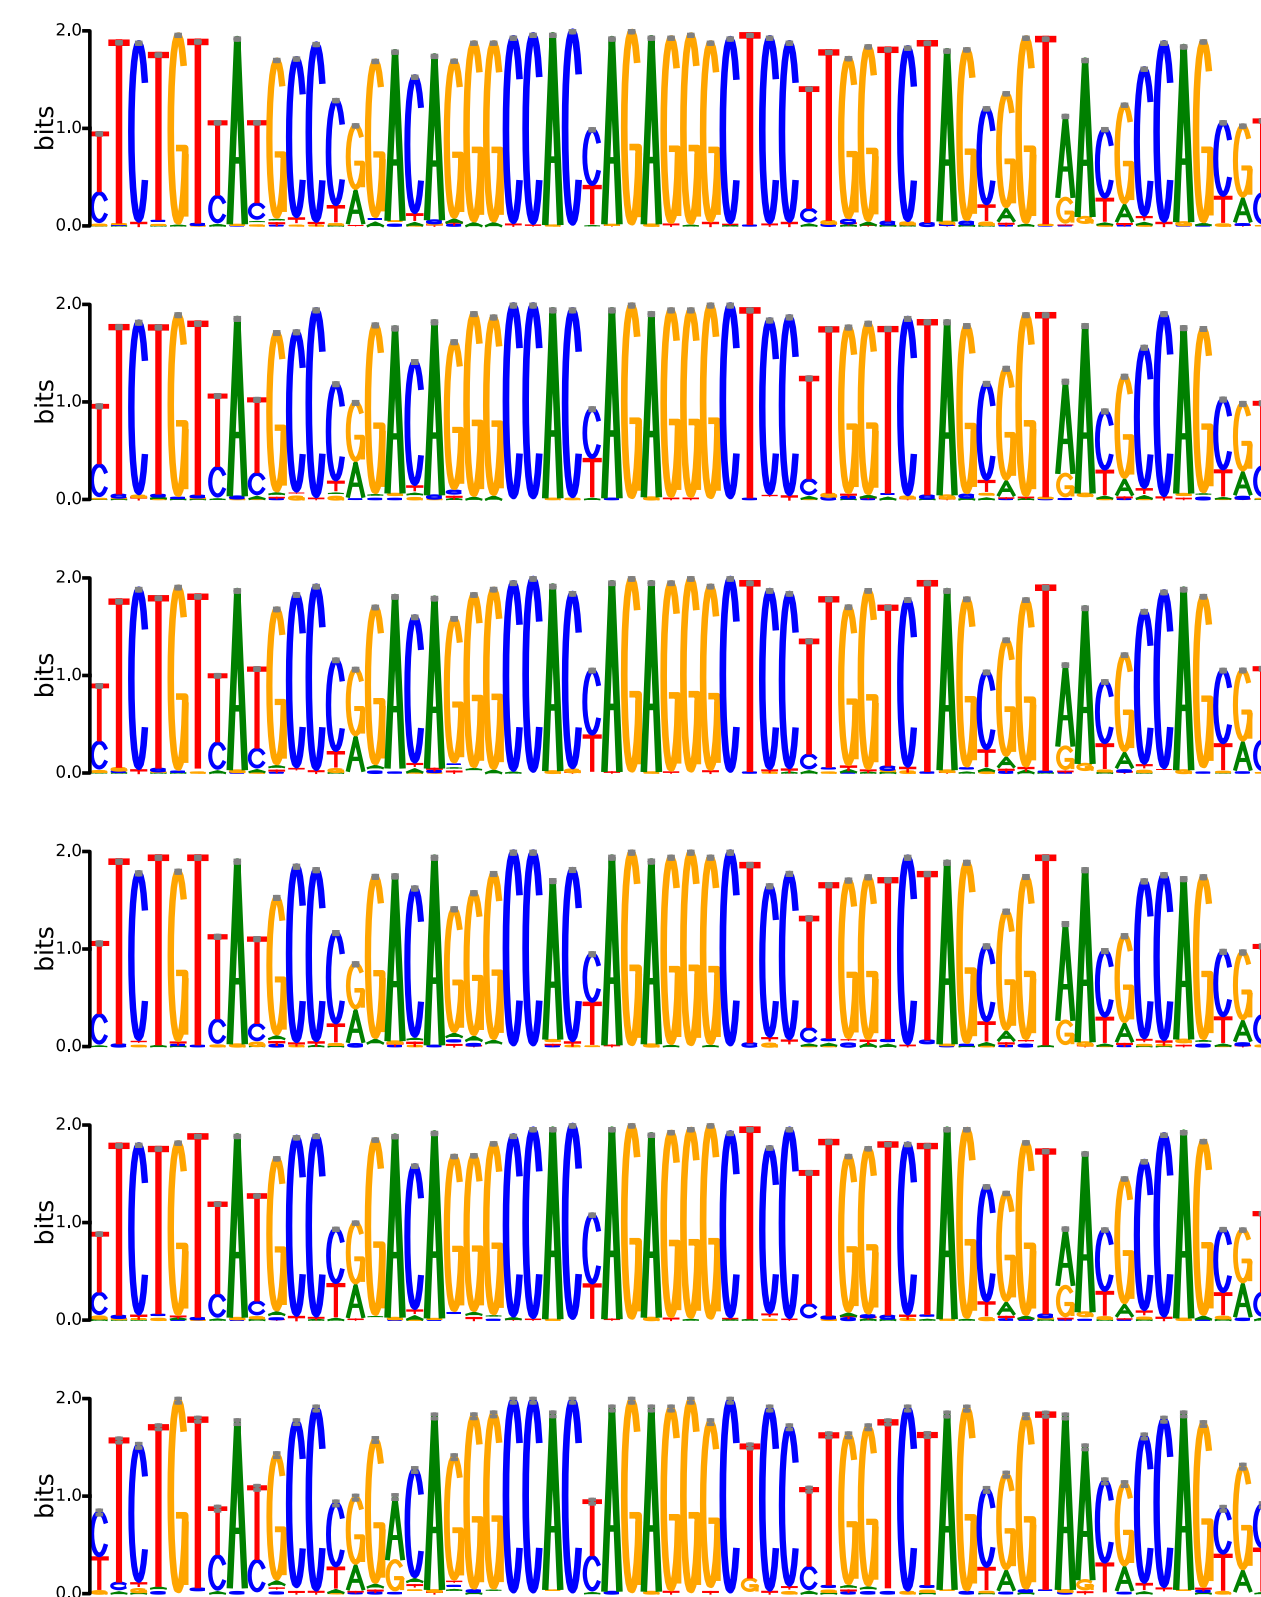

Few events of genome expansion through transposons involving CTCF sites

Loops

Conservation of CTCF sites

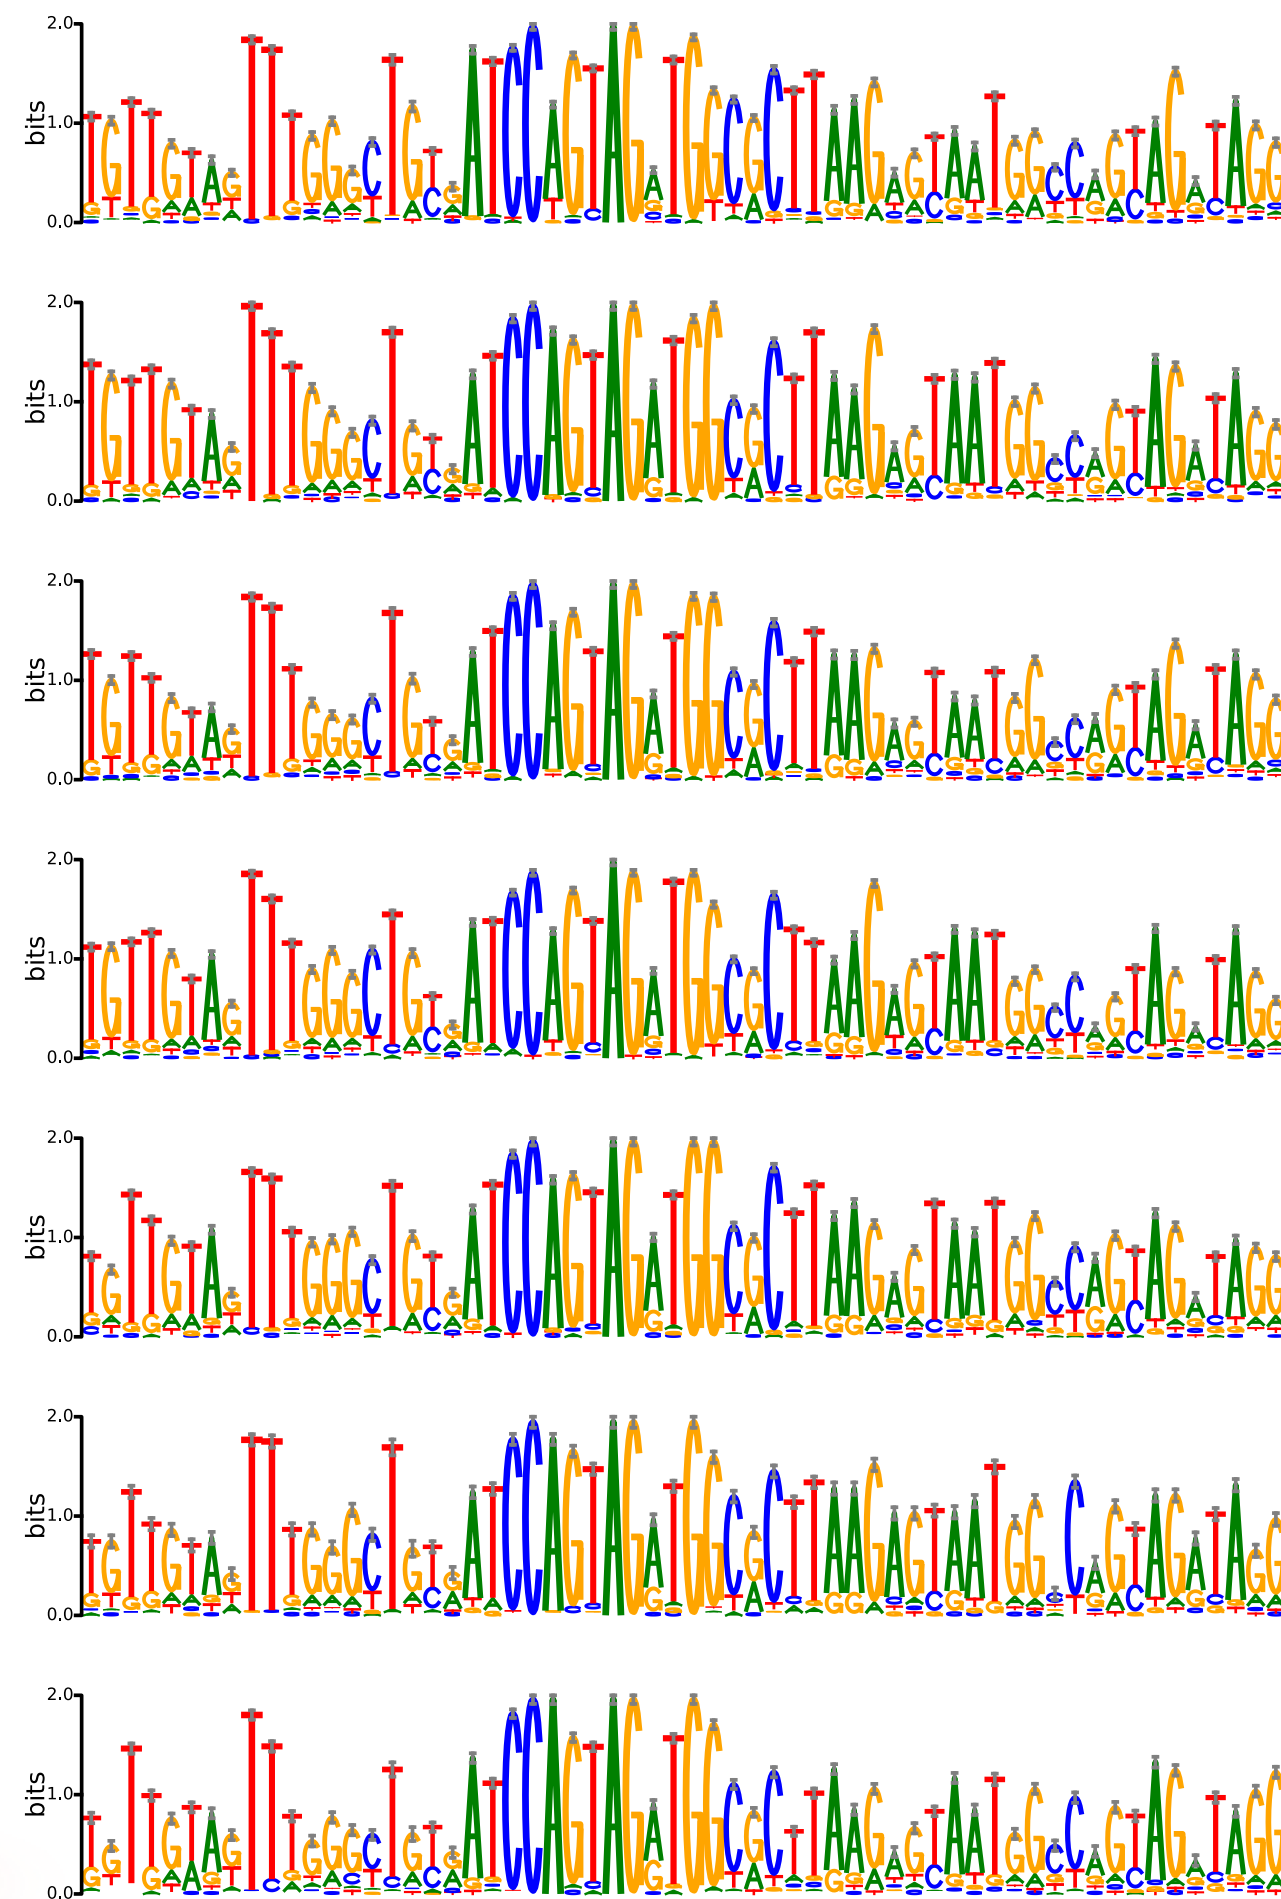

LTR13 (Long Terminal Repeat) for HERVK13 endogenous retrovirus

Loops

Conservation of CTCF sites

LTR
LINE
SINE
DNA
Total

3' end of L1 retrotransposon, L1PA16_3end subfamily

Conservation of CTCF sites

LINE L1 specific of *Callithrix jacchus* (Marmoset)

Summary

- Conservation of 3D structure after chromosomal rearrangements.
- Recently duplicated regions are more isolated from surrounding DNA.
- Compartments are very conserved in primates; detectable changes may not be related to cell-specific features.
- TAD borders conserved with similar selective strength against gain and loss
- New, but few primate specific expansions carrying CTCF sites
- Selection against the creation of new and strong CTCF sites

What next?

Can we see the path of chromatin @10Kb resolution? images + Hi-C + modeling

Is there a dynamic coupling between structure and gene activity?

The End!
